

Map of the Marine-Coastal Ecosystems from the Cuba Archipelago

¹ Cabrera Miguel ¹Instituto de Geología y Paleontología, La Habana, Cuba.

Upon the base of original, geological and geomorphic investigations, scientists have established the existence of ten marine-coastal ecosystems in the Cuban archipelago. They are located between the limits of deep waters and the break water of the isle of Cuba. A geological environmental zone of the most investigated regions, as well as the methodology of study that was used accompanies this map. Now a day, these results are used for carry out the supportable development policy and the protection of the biodiversity in the marine-coastal ecosystems of the Cuban Archipelago.
