

## **Stratigraphy and Ammonite fauna of Dalichai and Lar Formation (Middle Jurassic to Neocomian) in Kuh\_e\_Sharaf (Eastern Alborz, Iran)**

Mohammadi\_Monfared, M., Geological Survey of Iran, Tehran, Iran.

A thick marine sequence of Middle Jurassic to Neocomian (1050 m.) has been studied at Kuh\_e\_Sharaf (50 Km. NE Semnan, Southeast Alborz, Iran).

This transgressive sequence (Dalichai and Lar Formation) follows with distinct disconformity on the clastic deposit of the Shemshak Formation (Lower to Middle Jurassic). This sequence consists a rich Fauna of Ammonoids and Calpionellids (Late Bajocian to Valanginian).

We can see continuous boundary between Jurassic – Cretaceous in the Lar Formation.
