

Regional Geological Prospects of Cenozoic Oil and Gas Accumulation Southward of A. P. Karpinsky's Latitudinal Tectonic Zone

MAKRUSHIN R.N.*, **FEDORCHUK V. P.***** Inst. of Economics of Min. Resources (VIEMS), Moscow, Russia.

Peculiarities and differences of the regional geology of Paleozoic-Mezozoic on the Western European and Siberian platforms and conjugate fold-block areas and their prospects of oil and gas accumulation in Cenozoic southward of A. P. Karpinsky's tectonic zone have been examined. The necessity to apply the results of regional geological research as important criteria in small-scale prognostic evaluations of prospects of oil and gas accumulations in Cenozoic within the large territories have been grounded.
