

THE EXPANSION OF PLANET EARTH

Over the last 4500 years the Earth has almost doubled in size due to expansion. As a result of this expansion sea levels have fallen progressively away from the land area exposing more and more land in the process. We see Dinosaur footprints around an ancient sea at a height of 1800 Mtrs. in Colorado, U.S.A. We know that the sea floor is spreading and we also know that more and more land surface is being created as a result, both on land and under the seas.

The internal heat of the earth is the engine of the Earth's expansion and Earthquakes and Volcanic activity are manifestations of that expansion.

The most important, and overlooked, aspect of the Earth's is the fact that it leads us to a direct link with the demise of the Dinosaurs and the origin of Ancient and mysterious civilizations in the high mountains of the World. The Incas in the high Andes, The Nile Civilization The Indus Civilization, The Yellow River and Mesopotamian Civilization that developed high up in the Valley of the Tigris and Euphrates rivers.

We have to pay more attention to the receding seas as more land surface is exposed on the Earth and we have to look back into the historical relevance of this receding sea phenomenon. If we do we will solve many related problems regarding how the Dinosaurs died and how ancient civilizations came to originate in the high mountains around the World.
