

GROUNDWATER POLLUTION AND LAND SUBSIDENCE IN HANOI CITY

Doan Van Canh - University of Mining and Geology, Hanoi, Vietnam.

At present, groundwater for Hanoi city supply has been quite seriously polluted and land subsidence, may be, has happened.

If we don't rearrange the bored well fields, in a near future, the land subsidence will be able to reach to one meter and groundwater will be able to pollute completely.

For protecting against those crises, the rearrangement of bored well fields is urgently needed, it means that we must develop bored well fields in the outside circle, especially that along the Red River bank, reduce gradually bored well fields, even reject completely them in the inside circle.
