

Environmental Impacts on the Coastal Zones.

Batista, H. J. A.; Enia; Melián, E. J. G.; ENIA - UNAICC; Cuba

Different negatives environmental impacts are shown by means of pictures sequences which have been generated or may generate in beaches zone due to the buildings of tourists resources and its respective infrastructure; such cases are Cayo Coco in Ciego de Avila; Santa Lucia Beach in Camagüey.

Examples of the affections originated by the different factors of the natural environment are shown, that is, biotic and non- biotic. Up-date engineering and architectural project elements that produce negative impacts are shown.

A real example of the matritial process sequence of identification, efficiency and impact assessment is included in the exposition, as well as the different preventing and correcting actions that are created.

The work generalizes ideas and concepts for the studies of the environmental impact, clearing up the role of the Geo-science in such studies, as well as the way to improve the engineering and architectural concepts in the design and projecting of tourist constructions and its joined infrastructure
